## **ABOUT TICK CONTROL, LLC**

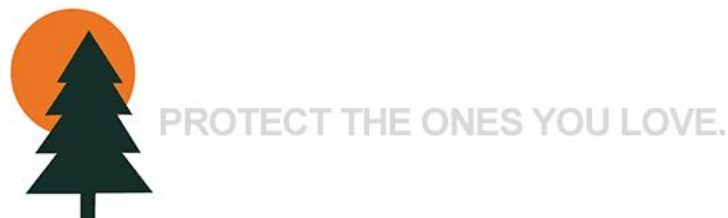

So many people ask me how I got into the business of combating ticks. I have to laugh because the people that know me would hardly think that I would be someone choosing to work with pesticides for a living. But life works in unpredictable ways and as such, a family member was sick for some time and doctors could not seem to figure out what was going on.

To make a long story short, he was finally diagnosed with Lyme Disease. Unlike the stereotypical cases you hear about, there was no rash or round ring, but he suffered from incredible inflammation in the joints and sagging on one side of his face. It was terrible.

I have lived in Connecticut my whole life and have been hearing of Lyme Disease in the news since the 70's and 80's. But it wasn't until it hit home that I did some extensive research and woke up to the fact that our state has a real problem on its hands.

It seems deer ticks have amassed to an infestation in Connecticut and the surrounding states. There has been much debate over the causes of the growth in the tick population, but whether it is due to climate change or a decline in hunting does not really matter. They are here, they are growing in numbers every year, and something has to be done about it.

So I decided that I would step up and start a business that would try to take a dent out of this growing problem. I'm a realist, let's face it, one company is not going to wipe out the entire state's problem

with ticks. So I never approached Tick Control, LLC with that mindset. Instead, I thought about all of the men, women, children, and pets I could potentially save from the debilitating disease that I witnessed my own family member endure.

This thought gave me the drive to approach our tick company not simply for the money, but with a passion to help people. Such passion drove me to build a quality service that was safe, effective and reliable and I believe that Tick Control, LLC is the best tick control service in CT.

### **TICK CONTROL, LLC** **TICK SPRAYING SERVICE**

Whether you live in [Fairfield County](#) and [New Haven County](#), Litchfield, Hartford, Middlesex, Tolland, Windham, or New London, you are no stranger to the incessant tick population surge in Connecticut.

Every year it just seems to keep getting worse. The black-legged deer tick (*Ixodes scapularis*) is a household word in our state, something we hear about Spring, Summer and Fall in the news. The dangers are undeniable; Lyme Disease, Powassan Virus, Babesiosis, and ehrlichiosis are just a few of the pathogens they carry. Any one of these can cause serious illnesses that can potentially change your way of life long term.

Residents of Connecticut have no choice but to take preventative measures when it comes to ticks. Hiring a professional tick spraying service like Tick Control, LLC is an easy and highly effective way to keep your family from the risks that ticks pose.

Choosing a tick control company is a bit more difficult because not all pest control services are equal. The product selection, amount of active ingredients and the care that is taken in applying your tick treatment is crucial to the effectiveness and safety of the application. Knowing exactly when to apply which type of product requires deep knowledge and experience in the field.

The take away for paying customers is peace of mind that you are truly protected. That's why I believe we are the best tick control company in CT. Our attention to detail is unparalleled and our track record reflects our efforts.

Professional tick control tick sprayers in Stratford, Milford, Orange, Oxford, or Southbury

**IDENTIFYING TICKS IN CONNECTICUT**

The black-legged deer tick is a staple in our state but did you know that there are several others that we also need to be concerned with?

Unfortunately, it's true. Not only are we concerned with ticks that are fairly native to Connecticut, but also of two new to the area invasive species migrating from the south. It is good to be able to identify ticks when you see them. Proper **tick identification** can help you in the event that you get bit. This information can be important to physicians.

Here is an abbreviated list of ticks in the northeast, the pathogens they carry, and disease they can cause. (Content source: [Centers for Disease Control and Prevention](#))

### **Black-Legged Tick**

#### **VECTOR OF:**

- Borrelia burgdorferi and B. mayonii (Lyme disease),
- Powassan virus (Powassan virus disease)
- B. miyamotoi disease (relapsing fever)
- Anaplasma phagocytophilum (anaplasmosis)
- Babesia microti (babesiosis)
- Ehrlichia muris euclairensis (ehrlichiosis)

#### **TICK INFORMATION:**

- The black-legged deer tick can be active all year. It has a two year lifecycle and is most active in the Spring, Summer and Fall. That said, adults can be active in the Winter as well. The areas where these ticks can be found are the Northeast, the mid-Atlantic and the Upper Midwest.

### **American Dog Tick**

#### **VECTOR OF:**

- Rickettsia rickettsii (Rocky Mountain spotted fever)
- Francisella tularensis (tularemia)

#### **TICK INFORMATION:**

- The greatest risk of being bitten occurs during spring and summer. Adult females are most likely to bite humans.

### **Brown Dog Tick**

#### **VECTOR OF:**

- Rickettsia rickettsii (Rocky Mountain spotted fever)

#### **TICK INFORMATION:**

- While this tick will bite other mammals, including humans, its host is most commonly dogs. It will seek dogs in each stage of its lifecycle. It is the primary

carrier of *Rickettsia rickettsii* transmission in the southwestern United States and on the U.S./Mexico border.

### Lonestar Tick

#### VECTOR OF:

- Ehrlichia chaffeensis and E. ewingii (human ehrlichiosis)
- Bourbon virus (Bourbon virus disease)
- Francisella tularensis (tularemia)
- Heartland virus (Heartland virus disease)
- Southern tick-associated rash illness (STARI).

- TICK INFORMATION: The Lonestar tick is an aggressive tick that has migrated from the south. There have been Lone Star ticks found in Connecticut. Unlike other ticks that quest, these ticks will actually pursue a host. It does bite humans and will bite anytime from Spring through Fall. This tick is easily distinguishable with the white spot on its back. These are identified as females and they, along with nymphs, are most likely to bite humans.

### Groundhog Tick

#### VECTOR OF:

- Powassan virus (Powassan virus disease).

#### TICK INFORMATION:

- These ticks like warm-blooded animals such as skunks, squirrels, foxes, raccoons and sometimes pets and humans. They sometimes go by the name of "Woodchuck tick". They are lightish brown in color.

### Asian Longhorned Tick

#### VECTOR OF:

- Powassan virus (Powassan virus disease), Japanese Spotted Fever, Thrombocytopenia Syndrome.

#### TICK INFORMATION:

- Recently found in Connecticut, this tick is an invasive species known to attack livestock in masses. Thousands of ticks can be found on animals who have succumbed to their bite. What makes these ticks most concerning is that their population can grow rapidly due to the fact that they clone themselves and

need no male to reproduce. These ticks can also bite humans and domesticated animals.
